

check installation / setup

Clone the `astropy-workshop` repository
(or Download ZIP)

<https://github.com/astropy/astropy-workshop/>

check installation / setup

Change directory to `astropy-workshop` and pull changes, or download a new ZIP file. Follow the directions in the `UPDATING.md` file.

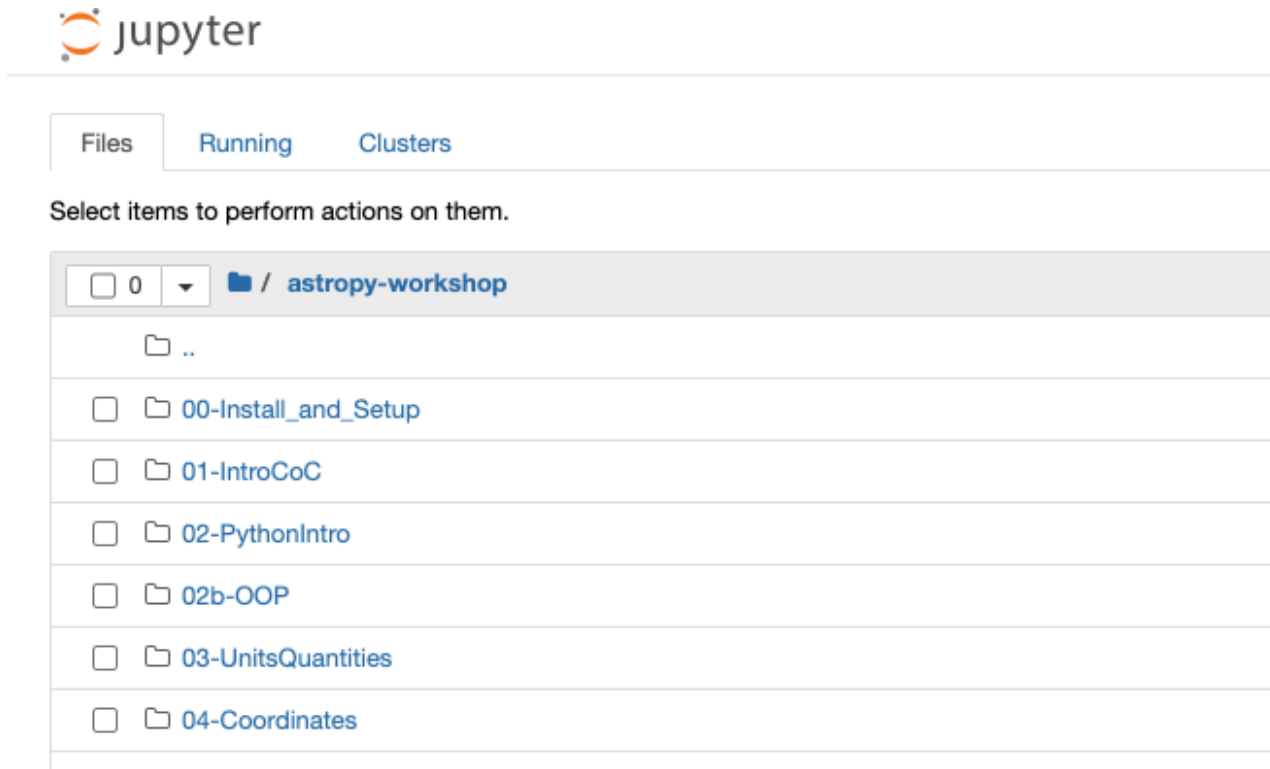

Activate environment with `mamba activate astropy-env`

Run the check environment script:

```
python 00-Install_and_Setup/check_env.py
```

<https://github.com/astropy/astropy-workshop/>

run from top level

start `jupyter notebook` from `astropy-workshop` directory

launch Binder instance

Launch a Binder instance with everything included

PRE-WORKSHOP SETUP

Please be sure your laptop is properly configured before the workshop by following the [installation and setup instructions](#).

This could take as long as *one hour* depending on your current configuration and internet speeds.
DO NOT WAIT UNTIL THE DAY OF THE WORKSHOP.

As an alternative, a workshop session can be run on mybinder.org via this link

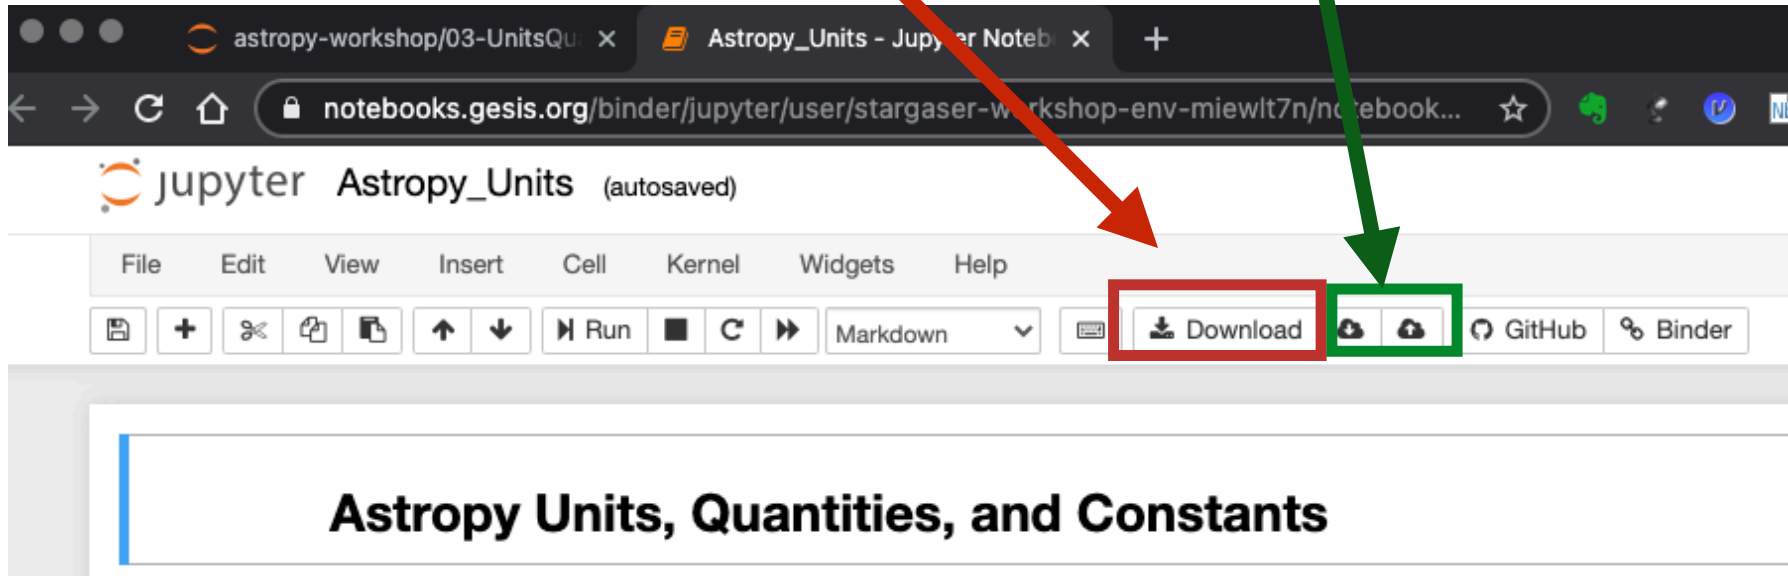

Schedule

<https://github.com/astropy/astropy-workshop#pre-workshop-setup>

handling Binder timeouts

Download notebook

save & restore from
browser storage

<https://discourse.jupyter.org/t/getting-your-notebook-after-your-binder-has-stopped/3268>

handling Binder timeouts

If your session times out (10 minutes idle), you can still save and restore each notebook tab; or download the notebook

During the break, you can execute in a new notebook cell

```
import time; time.sleep(10*60)
```

The “launch:binder” will work after the workshop
